Problem Statement:

In my locality there are a lot of areas where there are no restaurants and people do not even get food delivery. A friend of mine was to open a cloud kitchen, he wants to start the kitchen in areas where the delivery is not happening currently.

Data:

By analyzing the Google maps data, we can find which locality does not have many restaurants under 5 KM area. Based on that he can start a cloud kitchen and start delivering the food online. If he succeeds in one area using the same models. I can suggest him the expansion plan.
